Motivation from LS Le verage s cores capture the leverages of each example on the best fit." min IIA x - b II2 A EIR " b EIR" $x = (A^T A)^T A b$ $b := A x^* = A (A^T A)^{-1} A^T b$ $A = \sum_{i=1}^{n} \sigma_{i} u_{i} v_{i}^{T} (SD)$ i= 1 $A(A^{T}A)A^{T}=(\Sigma\sigma,u,V^{T})(\Sigma\sigma,V^{T})$ (I Zo-v. u.) = In, u.

This is the Projetion matrix onto col(A). Denote by H= \(\frac{1}{2} u, u, \frac{1}{2} \)

Def: The i-th leverage Score of A is $X_{i} = H(i,i) = 11 U(i,i)11^{-1}$ where u = (u, ... u,) Observations a. k: E [0,1],

$$\frac{b}{\sum_{i=1}^{n} \sum_{j=1}^{n} ||j||^{2}} = \sum_{i=1}^{n} ||j||^{2} = \sum_{i=1}^{$$

E. Therefore, if
$$R_i = 1$$

$$\hat{b}_i = H(i, :| b = H_i, b_i = b_i)$$
Similarly if R_i is small,
then b_i has little effect
on \hat{b}_i .

Example: $X_1 = \hat{b}_1 \times Z_2 = R$ so
$$A = \begin{pmatrix} 6 \\ 8 \end{pmatrix} = \begin{pmatrix} 0.6 \\ 0.8 \end{pmatrix} \begin{pmatrix} 10 \end{pmatrix} \cdot \begin{pmatrix} 1 \\ 1 \end{pmatrix}$$

$$UU^T = \begin{pmatrix} 0.36 & 0.48 \\ 0.48 & 0.64 \end{pmatrix}$$
Given $y_1^{i_1}, y_2^{i_2}$, we have

0.36. 4, - 0.48 4 2 y = 0.489, + 0.64 42 The more distant example is more influential. Example Let X1=0, X2=1. Then 2=1 so we exactly fit X2. TODO: d. App to low-rank a. Analyze sampling V b. How to approx 8: C. Fl makes leverage SEOVES uniform

Leverage sampling Goal: relative error bounds. Given AEIR^{nx*}, we would like to sample rows of A s.t. w.h.p. the rescaled sampling matrix SEIR^{sxn} satisfies w.h.p.: $(\forall x)$ $||SAx||^2 = (1 \pm \varepsilon) ||Ax||^2$ | x TATSTSAx - x TATAX | < EXTATAX $(\forall x)$ As opposed 20 11×112 Often more ambitions since if x corresponds to tiny eigenvalue of ATA, the RHS

is small. Preconditioning; How can we express the desired inequality as spectral norm bound? Let $x \in \mathbb{R}^d$. We can restrict our attention to $x \in row(A)$. Then ByER S.t. x = VI'y, where A=UIVT is the SVD of A. Since AVZ = UIVTVI = U, we obtain that (x) is equivalent to (Yy) | y u s suy - y u uy | $\leq \varepsilon ||y||^2$

11 UTSTSU-UTUILLE Sample szadln(n)/ & rows according to squared-length sampling according to U! (=) Leverage szore sampling! Obstacle: computing leverage scores (exactly) requires computing the SVD. We'll show how to approximate them using sketching

Ridge leverage scores Idea: replace rank(A) by "effective rank" of A. For parameter x>0, we aim at sampling rows of A s.t. w.h.p. (Vx) |xTATSTSAx-xTATAX| & $\varepsilon x^{\mathsf{T}} (A^{\mathsf{T}} A - \lambda \mathcal{I}) x$ (***) relative ervor - Small Slack $A = U \Sigma V^T$ Notation: ATA+X I= VI VT

Given
$$x \in \mathbb{R}^d$$
 $\exists y \ s.t. \ x = V = y$.

Then $(*x) \Leftarrow (\forall y)$

$$| y = \int_{-\infty}^{\infty} \sum U^T S = \int_{-\infty}^{\infty} y | S \in \mathbb{R}^d$$

$$- y = \int_{-\infty}^{\infty} \sum U^T U = \int_{-\infty}^{\infty} y | S \in \mathbb{R}^d$$

Sample according to rows of

 $Z = U = \int_{-\infty}^{\infty} \sum U_{ij} = \int_{-\infty}^{\infty} |(\sigma_j^2 + x)|$

$$= \int_{-\infty}^{\infty} \sum U_{ij} = \int_{-\infty}^{\infty} |(\sigma_j^2 + x)|$$

$$= \int_{-\infty}^{\infty} \sum U_{ij} = \int_{-\infty}^{\infty} |(\sigma_j^2 + x)|$$

Ridge leverage score

Exercises 1) Let A = (-a1-) EIR nx d and suppose that a; \$\noting{\pi}\$ spansa; \$\mathcal{j}\$ \$\pi\$ i]. Show that & := 1. 2) Show Y & = min } 11x112: x E 12h, ATx=a; {. Use this to reprove Ex. 1. Prove that R:= min } t zo: a, a, x t A A }

```
Solutions
  (1) Let A.; correspond to removing a;
    Then \forall j \neq i, R_j(A_i) \geq R_j(A). Since
  adding a: increases the rank by 1,
rank(A, 1= \sum_{j \neq i} R_j (A_{-i}) \ge \sum_{j \neq i} R_j (A) \ge \sum_{j \neq i} R_j (A) - (R_i(A) - 1)
      = rank (A) - 1
  Since the LHS is equal to the RHS, all the inequalities are equalities,
  hence 2: (A)=1.
```

2 Define
$$f:|R^n \rightarrow R|$$
 by $f(x)=1|x||^2$.

In in $f(x)$

S.t. $A^T x = a$;

Il (opt conditions)

 $2x = \nabla f(x) \in row(A^T)$
 $x^* = (A^T)^T a$;

 $1|x^*||^2 = a$; $(A^T)^T A^T a$; $= a$; $(A^TA)^T a$;

Reproving 1: Suppose a ; $\notin SP A j$; $j \neq i \nmid 1$.

Then given x Satisfying $a = A^T x = \sum x_i a_j$, we have

 $a = \tilde{a}, = \tilde{a}, = \sum x_i a_j = x_i a_i$

In T $j \neq i$

Sp SP

Taxing inner product with \tilde{a} ; we get

 $||\tilde{a}, ||^2 = x$; $a, = \tilde{a}, = x$; $||\tilde{a}, ||^2$
 $||\tilde{a}, ||^2 = x$; $||\tilde{a}, ||^2$
